

Abstract of the Disclosure
A Collating Device

5 A collating device for sheet material comprises a collating
station (1) having a pair of guide members (8, 10) for
receiving sheets to be collated through an opening (9)
therebetween, first conveyor means (3) for conveying sheets
consecutively into the collating station and second
10 conveyor means (5) for conveying a collated stack of sheets
out of the collating station, support means (12) biased
towards a position for supporting sheets in the collating
station away from the second conveyor means, and an
actuator member (14) movable to urge a collated stack of
15 sheets towards the second conveyor means against the bias
of the support means.
